

YOUR SITE IS BLEEDING.

Bleed reads a local restaurant's website and tells the owner, in euros a year, what it is costing them. Every figure shows the assumption behind it.

NOBODY HAS EVER PUT **A NUMBER** ON IT

Local restaurants hand a third of every delivery order to an aggregator. Most already own the channel that would keep that money, paid for and unused. They cannot act on it because nobody has told them what it costs.

76.4%

of Spanish restaurants that deliver depend entirely on an aggregator

BCC INNOVATION / DELECTATECH, 240K VENUES, 2022

13–35%

commission taken on every single order

SECTOR RATE COMPARISON, 2025

58%

of diners would rather order from the restaurant directly

NCR VOYIX, US SURVEY, 2025

PASTE A URL. GET THE **BILL**.

One input, one minute, no account. Bleed crawls the site, works out which leaks matter for that specific business, prices each one against calibrated constants, and writes the case in language the owner actually speaks.

MEASURED Stack, order path, load time, image weight, aggregator links, open catalogue.

JUDGED A model decides which leaks matter for this business and why, here.

PRICED Deterministic arithmetic over constants that carry their source and date.

ARGUED A one-page dossier for a non-technical owner, with the assumptions attached.

THE MODEL JUDGES. THE CODE CALCULATES. NEITHER DOES THE OTHER'S JOB.

TWO USERS, ONE REPORT

THE OWNER	Runs one to three venues. Not technical. Knows something is wrong with delivery margins but has no way to size it. Wants a number and a next step, not an audit.
THE AGENCY	Sells web work to local business. Currently opens with "your site is old". Bleed hands them an opening that is a euro figure with a citation, and a dossier to leave behind.
NOT FOR	Enterprise. Chains with in-house teams. Anyone who already has the number.

SHIPPED, NOT MOCKED

RECON	Live HTTP crawl: stack detection, WooCommerce Store API, schema.org hours, aggregator links, image weight, time to first byte.
TRIAGE	Structured-output model pass that ranks the leaks that apply to this business and says why they matter here.
QUANTIFY	Seven leak types priced from seven calibrated constants. Numbers with no published source are labelled on screen as team estimates.
SIMULATE	The owner edits the assumptions live and the report recalculates. Their numbers beat our averages.
DOSSIER	Generated brief, with a deterministic fallback when the model is unavailable.

FOUR STAGES, TWO ENGINES

1. recon DETERMINISTIC Fetch, parse, measure. Facts only, no interpretation.	2. triage GEMINI-3.6-FLASH Structured output. Picks and ranks leaks from a closed catalogue. Returns judgement, never euros.	3. quantify DETERMINISTIC Arithmetic over cited constants. Auditable, repeatable, no hallucination surface.	4. dossier GEMINI-3.6-FLASH Writes the owner's case. Falls back to a template if the model is unavailable.
---	---	--	---

The split is the design decision. Letting a model invent revenue figures is a hallucination waiting to be quoted back at a real business. Letting it judge what matters is exactly what it is good at. Every model output is validated against a closed catalogue before it is used.

HONEST ABOUT THE BOUNDARY

MODEL DOES	Reads the business from its own site. Decides which of the leaks apply here and ranks them. Explains why each matters for this venue specifically. Writes the owner's brief.
CODE DOES	Every measurement. Every euro. Every citation. Structured-output validation that rejects any leak the model invents.
NOBODY DOES	Guess. When a figure needs the owner's own data, the report says so instead of filling it in.

Two of the constants proposed during development were rejected because their only sources were vendors selling the fix. That rule is enforced in the codebase, not just claimed on a slide.

CALIBRATED ON 132 REAL SITES

163 restaurant websites in Málaga sampled from OpenStreetMap, 132 audited one by one. The constants are not guessed; they are checked against what is actually out there.

59 / 132

time to first byte over 1.5 seconds

MEASURED

35 / 132

over 2 MB of images on the homepage

MEASURED

10 / 132

expose their full catalogue and prices publicly

MEASURED

8

announce end-of-life PHP in their headers

MEASURED

A NUMBER THEY CAN **ACT ON**

FOR THE OWNER

A mid-size aggregator-dependent restaurant is losing on the order of thousands a year to commission it could keep. Bleed sizes it in a minute, for free, with the maths shown.

MODEL

Free audit as the wedge. Paid tier for the agency: batch a whole postcode from OpenStreetMap, white-label the dossier, track which leads converted.

WHY NOW

Aggregator dependence is at a peak and margin pressure is real. The data to price it is public. Nobody is pointing it at the owner.

WHAT COMES **NEXT**

NEXT Browser tier in the recon so JavaScript-rendered sites return a full report. Today they return a thin one, and the report says so.

THEN Beyond restaurants: dentists, gyms, salons. Each trade needs its own calibrated constants, which means its own field study. No claims until that work is done.

THEN Batch mode for agencies: a postcode in, a ranked list of leads out, each with its dossier.

ALWAYS Every new constant carries a citable source and a date, or it does not compute euros.
